Univent SRV

The **Univent SRV** (self relieving vent) has been designed to help you stay cooler through the long hot days and nights the Australian Summer can deliver.

The idea of the **Univent SRV** is to relieve approximately 25-30% of the air that is delivered into your home from the Ducted Evaporative Cooling system into your roof space. This is achieved by the air relief groove that is around the perimeter of the diffuser.

The **Univent SRV** has been designed for the times when you have to leave the house to do the shopping or pick the kids up from school etc but you don't want to turn the Evaporative Cooler off, and you can't leave it running without leaving either doors or windows open as this is a security risk.

Other times when you would like to feel more secure is when you are asleep at night. The thought to many people of leaving windows and doors open at night is terrifying with reports on the news of home intrusions occurring during this time.

Because the **Univent SRV** relieves the air into the roof space, as the temperature in the house lowers, the air being relieved into the roof is lower. This cools your roof which in turn helps lower the temperature inside your house by not re-heating the air.

What all this means is that you get;

- › A secure house that stays cooler.
- › Extra cooling efficiency.
- › Less water dumping from the cooler as you turn it off less.
- › Peace of mind.

So if you want to be cooler and feel secure, remember **Univent SRV**.

All you need to do before you leave the house or retire for the evening is turn the fan speed down on the Evaporative Cooler controller to approximately 25-30% and you are done.
